Ξ

Consider a mixed-integer linear program:

$$egin{array}{ccc} \min_{x} & c^{ op}x & \ ext{s.t.} & x \in S, \end{array} \end{array}$$

where  $S \equiv \{x \in P : x_i \in \mathbb{Z} \ \forall i \in I\}, P \equiv \{x \in \mathbb{R}^n_+ : Ax = b\}, I \subseteq [n].$ 

We aim to identify Gomory cuts for problem (1).

- Gomory fractional inequalities (for pure integer programming) [Gom10]
- Gomory mixed-integer inequalities (GMI)
- The relationship between GMI and split inequalities (MIR and lift-and-project)
- How to strengthen GMI

Reading materials: [C<sup>+</sup>07, Cor08, Fuk10, CCZ<sup>+</sup>14]

・ロト ・同ト ・ヨト ・ヨト

In our previous talk, we discussed two perspectives for generating valid inequalities for MILPs:

- algebraic perspective: e.g., Chvatal procedure
  - i. Take combinations of the known valid inequalities.
  - ii. Use rounding to produce stronger ones
- geometric perspective: e.g., split inequalities
  - i. Use a disjunction to generate several disjoint polyhedra whose union contains  ${\cal S}$
  - ii. Generate inequalities valid for the convex hull of this union

## Remark

The geometric perspective provides a natural way to strengthen those generated inequalities.

Given a pure integer program (i.e., I = [n]), consider a simplex tableau

$$x_i + \sum_{j \in N} \bar{a}_{ij} x_j = \bar{a}_{i0} \quad \forall i \in B.$$
(2)

If  $\bar{a}_{i0} \notin \mathbb{Z}$  for some  $i \in B$ , then apply the Chavatal-Gomory procedure

$$x_i + \sum_{j \in N} \lfloor \bar{a}_{ij} \rfloor x_j \le \lfloor \bar{a}_{i0} \rfloor.$$
(3)

By subtracting (3) from (2), we obtain

$$\sum_{j\in N} f_{ij} x_j \ge f_{i0},\tag{4}$$

where  $f_{ij} = \bar{a}_{ij} - \lfloor \bar{a}_{ij} \rfloor$ . (4) is called a Gomory fractional inequality

Akang Wang wangakang@sribd.cn

An Introduction to Gomory Cuts

Given a pure integer program (i.e., I = [n]), consider a simplex tableau

$$x_i + \sum_{j \in N} \bar{a}_{ij} x_j = \bar{a}_{i0} \quad \forall i \in B.$$
(2)

If  $\bar{a}_{i0} \notin \mathbb{Z}$  for some  $i \in B$ , then apply the Chavatal-Gomory procedure

$$x_i + \sum_{j \in N} \lfloor \bar{a}_{ij} \rfloor x_j \le \lfloor \bar{a}_{i0} \rfloor.$$
(3)

By subtracting (3) from (2), we obtain

$$\sum_{j\in N} f_{ij} x_j \ge f_{i0},\tag{4}$$

where  $f_{ij} = \bar{a}_{ij} - \lfloor \bar{a}_{ij} \rfloor$ . (4) is called a Gomory fractional inequality.

# **Gomory fractional inequalities**

Shenzhen Research Institute of Big Data

#### Example

$$\max_{x} 5.5x_{1} + 2.1x_{2}$$
s.t.  $-x_{1} + x_{2} \le 2$ 
 $8x_{1} + 2x_{2} \le 17$ 
 $x_{1}, x_{2} \in \mathbb{Z}_{+}$ 

$$x_{2} + 0.8x_{3} + 0.1x_{4} = 3.3 \Longrightarrow \frac{8}{3}x_{3} + \frac{1}{3}x_{4} \ge 1$$
(5)

#### Remarks

- Gomory fractional inequality (4) always cuts off the current solution  $\bar{x}$ .
- [Gom10, WN99] proposed a finite cutting plane algorithm (i.e., lexicographic dual simplex) for pure integer programming problems using Gomory fractional cuts.

∃ ≥

# **Gomory fractional inequalities**

X2 -

Shenzhen Research Institute of Big Data

#### Example

$$\max_{x} 5.5x_{1} + 2.1x_{2}$$
s.t.  $-x_{1} + x_{2} \le 2$ 
 $8x_{1} + 2x_{2} \le 17$ 
 $x_{1}, x_{2} \in \mathbb{Z}_{+}$ 
 $(5)$ 
 $-0.8x_{3} + 0.1x_{4} = 3.3 \Longrightarrow \frac{8}{2}x_{3} + \frac{1}{2}x_{4} \ge 1$ 

## Remarks

- Gomory fractional inequality (4) always cuts off the current solution  $\bar{x}$ .
- [Gom10, WN99] proposed a finite cutting plane algorithm (i.e., lexicographic dual simplex) for pure integer programming problems using Gomory fractional cuts.

E

Given a general MILP, consider a simplex tableau

$$x_i = \bar{a}_{i0} - \sum_{j \in N} \bar{a}_{ij} x_j \quad \forall i \in B.$$
(6)

We can rewrite the RHS of (6) as

$$\lfloor \bar{a}_{i0} \rfloor + f_{i0} - \sum_{\substack{j \in \mathcal{N} \cap I: \\ f_{ij} \leq f_{i0}}} \left( \lfloor \bar{a}_{ij} \rfloor + f_{ij} \right) x_j - \sum_{\substack{j \in \mathcal{N} \cap I: \\ f_{ij} > f_{i0}}} \left( \lceil \bar{a}_{ij} \rceil - 1 + f_{ij} \right) x_j - \sum_{j \in \mathcal{N} \cap C} \bar{a}_{ij} x_j$$

As a result,

$$z \equiv f_{i0} - \sum_{\substack{j \in N \cap I: \\ f_{ij} \leq f_{i0}}} f_{ij} x_j - \sum_{\substack{j \in N \cap I: \\ f_{ij} > f_{i0}}} (f_{ij} - 1) x_j - \sum_{j \in N \cap C} \bar{a}_{ij} x_j \text{ is an integer}$$

Akang Wang wangakang@sribd.cn

(日) (四) (三) (三) (三)

Given a general MILP, consider a simplex tableau

《曰》 《國》 《臣》 《臣》

# GMI

**深圳市大数据研究院** Shenzhen Research Institute of Big Data

Shenzhen Research Institute of Big Data

## Remarks

- The inequality (10) always cuts off the basic feasible solution  $\bar{x}$ .
- One can rewrite inequality (9) as

$$\sum_{j \in N \cap I} \min\left\{\frac{f_{ij}}{f_{i0}}, \frac{1 - f_{ij}}{1 - f_{i0}}\right\} x_j + \sum_{j \in N \cap C} \max\left\{\frac{-\bar{a}_{ij}}{1 - f_{i0}}, \frac{\bar{a}_{ij}}{f_{i0}}\right\} x_j \ge 1$$
(10)

- For pure integer programs, GMI (9) dominates Gomory fractional inequality (4).
- When rewriting (6), one can replace ā<sub>ij</sub> by Lā<sub>ij</sub> + f<sub>ij</sub> for each j ∈ N ∩ I. However, the resulting cuts will be dominated by (9).
- When formulating (7), one may want to use  $z \le k \lor z \ge k+1$  where  $k \ne 0$ . This would fail to produce a desirable system.
- A finite cutting-plane algorithm for solving MILPs via GMI does not exist [WN99].

Akang Wang wangakang@sribd.cn

Consider a simplex tableau that corresponds to basis *B*:

$$x_i = \bar{a}_{i0} + \sum_{j \in N} - \bar{a}_{ij} x_j \quad \forall i \in B.$$

The corner polyhedron associated with B is given by

$$P(B) \equiv \bar{x} + Cone(\{r^j\}_{j \in N}) \\ = \{x \in \mathbb{R}^n : Ax = b, x_j \ge 0 \ \forall j \in N\}.$$

Akang Wang wangakang@sribd.cn

# Intersection cuts

Shenzhen Research Institute of Big Data

Consider a convex set K such that  $\bar{x} \in int(K)$  and  $int(K) \cap S = \emptyset$ , then one can generate an intersection cut given by

v.

$$\sum_{j \in N} \frac{\lambda_j}{\alpha_j(K)} \ge 1,$$
  
where  $\alpha_j(K) \equiv \max_{\alpha} \{ \alpha : \bar{x} + \alpha r^j \in K \}.$ 

Interested readers are referred to "An Introduction to Intersection Cut and Their Applications".

Akang Wang wangakang@sribd.cn

#### An Introduction to Gomory Cuts

## Definition (Split inequalities)

Given *P* and *S*, an inequality  $\alpha^{\top}x \leq \beta$  is a split inequality if there exists a split  $(\pi, \pi_0)$  with  $\pi_I \in \mathbb{Z}^p, \pi_C = 0$  and  $\pi_0 \in \mathbb{Z}$  such that  $\alpha^{\top}x \leq \beta$  is valid for both sets

$$\Pi_1 \equiv \left\{ x \in P : \pi^\top x \le \pi_0 \right\}, \\ \Pi_2 \equiv \left\{ x \in P : \pi^\top x \ge \pi_0 + 1 \right\}.$$

Consider an intersection cut induced by a convex set

$$\left\{x \in \mathbb{R}^n : \pi_0 \le \pi^\top x \le \pi_0 + 1\right\},\,$$

where  $(\pi, \pi_0)$  is a split with  $\pi_0 \equiv \lfloor \pi^\top \bar{x} \rfloor$ , we can compute

$$\begin{split} \alpha_{j} &= \max_{\alpha} \left\{ \alpha : \pi_{0} \leq \pi^{\top} (\bar{x} + \alpha r^{j}) \leq \pi_{0} + 1 \right\} \\ &= \begin{cases} \frac{1 - \epsilon(\pi, \pi_{0})}{\pi^{\top} r^{j}} & \text{if } \pi^{\top} r^{j} > 0, \\ \frac{\epsilon(\pi, \pi_{0})}{-\pi^{\top} r^{j}} & \text{if } \pi^{\top} r^{j} < 0, \\ +\infty & \text{otherwise.} \end{cases} \end{split}$$

where  $\epsilon(\pi, \pi_0) \equiv \pi^{\top} \bar{x} - \pi_0$ .

#### Theorem

The GMI cut obtained from the row of the simplex tableau, in which  $x_i$  is basic, is the same as the intersection cut induced by a convex set  $\{x \in \mathbb{R}^n : \pi_0 \leq \pi^\top x \leq \pi_0 + 1\}$ , where

$$\pi_j \equiv egin{cases} \lfloor ar{a}_{ij} 
floor & ext{if } j \in N ext{ and } f_{ij} \leq f_{i0}, \ \lceil ar{a}_{ij} 
ceil & ext{if } j \in N ext{ and } f_{ij} > f_{i0}, \ 1 & ext{if } j = i, \ 0 & ext{otherwise}, \end{cases}$$

 $\pi_0 \equiv \lfloor \pi^\top \bar{x} \rfloor.$ 

《曰》 《國》 《臣》 《臣》

E

# GMI as split ineq.

Shenzhen Research Institute of Big Data

# Proof.

$$\epsilon(\pi, \pi_0) = \pi^\top \bar{x} - \pi_0 = \bar{x}_i - \lfloor \bar{x}_i \rfloor = f_{i0}$$
  
$$\pi^\top r^j = \pi_B^\top r_B^j + \pi_N^\top r_N^j = \begin{cases} \lfloor \bar{a}_{ij} \rfloor - \bar{a}_{ij} = -f_{ij} & \text{if } j \in N \cap I : f_{ij} \le f_{i0} \\ \lceil \bar{a}_{ij} \rceil - \bar{a}_{ij} = 1 - f_{ij} & \text{if } j \in N \cap I : f_{ij} > f_{i0} \\ -\bar{a}_{ij} & \text{if } j \in N \cap C \end{cases}$$

Akang Wang wangakang@sribd.cn

An Introduction to Gomory Cuts

Ξ

There are two perspectives to strengthen GMI:

- modify the basis while keeping the disjunction fixed
  - lift-and-project cut [BP03]
- modify the disjunction while keeping the basis fixed
  - reduce-and-split cut [ACL05]

One may combine the above two perspectives to further strengthen GMI:

- pivot-and-reduce [WKS11]
- alternate between lift-and-project and reduce-and-split [BCKN13]

In this talk, we will only introduce reduce-and-split cuts.

Motivation: for  $j \in N \cap C$ , smaller  $|\bar{a}_{ij}|$  values might lead to stronger GMI cuts.

Consider two rows of a simplex tableau:

$$x_i = \bar{a}_{i0} - \sum_{j \in N} \bar{a}_{ij} x_j, \ x_k = \bar{a}_{k0} - \sum_{j \in N} \bar{a}_{kj} x_j.$$

Given any  $\delta \in \mathbb{Z}$ , we obtain

$$x_i + \delta x_k = \bar{a}_{i0} + \delta \bar{a}_{k0} - \sum_{j \in N} \left( \bar{a}_{ij} + \delta \bar{a}_{kj} \right) x_j.$$

We then aim to minimize  $\sum_{j \in N \cap C} (\bar{a}_{ij} + \delta \bar{a}_{kj})^2$  to choose  $\delta$ , which is a fairly easy task.

#### Remarks

- Reduce-and-split cuts do not dominate GMI cuts.
- Geometric interpretation: given two splits (π<sup>i</sup>, π<sup>i</sup><sub>0</sub>), (π<sup>k</sup>, π<sup>k</sup><sub>0</sub>) defined as in Lemma 2, the reduce-and-split procedure is simply to utilize another split (π<sup>i</sup> + δπ<sup>k</sup>, π<sub>0</sub>) with π<sub>0</sub> = ⌊(π<sup>i</sup> + δπ<sup>k</sup>)<sup>⊤</sup>x̄⌋ to generate GMI cuts.

Consider a mixed-integer linear program with general variable bounds:

$$\begin{split} \min_{x} & c^{\top}x \\ \text{s.t.} & Ax = b \\ & x_{i}^{L} \leq x \leq x_{i}^{U} \quad \forall i \in [n] \\ & x_{i} \in \mathbb{Z} \qquad \forall i \in I \end{split}$$
 (11)

where  $-\infty \le x_i^L \le x_i^U \le \infty \ \forall i \in [n]$ . Let's write a simplex tableau associated with a basis *B*:

$$x_{i} = \bar{a}_{i0} - \sum_{j \in N^{L}} \bar{a}_{ij} \left( x_{j} - x_{j}^{L} \right) + \sum_{j \in N^{U}} \bar{a}_{ij} \left( x_{j}^{U} - x_{j} \right) \quad \forall i \in B,$$
(12)

where  $N^L$  denotes the index set of non-basic variables at their lower bounds and  $N^U \equiv N \setminus N^L$ .

If  $\bar{a}_{i0} \notin \mathbb{Z}$ , using the simplex tableau (12), we can derive an GMI inequality as follows:

$$\sum_{j \in N^{L} \cap I} \min\left\{\frac{f_{ij}}{f_{i0}}, \frac{1 - f_{ij}}{1 - f_{i0}}\right\} (x_{j} - x_{j}^{L}) + \sum_{j \in N^{L} \cap C} \max\left\{\frac{-\bar{a}_{ij}}{1 - f_{i0}}, \frac{\bar{a}_{ij}}{f_{i0}}\right\} (x_{j} - x_{j}^{L}) + \sum_{j \in N^{U} \cap C} \min\left\{\frac{f_{ij}}{1 - f_{i0}}, \frac{1 - f_{ij}}{f_{i0}}\right\} (x_{j}^{U} - x_{j}) + \sum_{j \in N^{U} \cap C} \max\left\{\frac{\bar{a}_{ij}}{1 - f_{i0}}, \frac{-\bar{a}_{ij}}{f_{i0}}\right\} (x_{j}^{U} - x_{j}) \\ \geq 1.$$
(12)

(13)

#### Remarks

- As long as x<sub>i</sub><sup>L</sup> and x<sub>i</sub><sup>U</sup> are valid bounds for x<sub>i</sub>, then the resulting GMI inequality (13) will be correct.
- For a superbasic variable j, since  $\bar{a}_{ij} = 0$  (due to  $B^{-1}a_j = 0$ ), we can simply skip variable j.
- Given a mixed binary program (i.e.,  $x_i \in \{0, 1\}$  for  $i \in I$ ), let  $F_0$  and  $F_1 \subseteq I$  denote the index sets of variables that have been fixed at 0 and 1, respectively, in some BB node. One can enforce  $F_0 \subseteq N^L \cap I$  and  $F_1 \subseteq N^U \cap I$  and generate a GMI inequality (13), which will be globally valid inequality [BCCN96]. We cannot extend this to general MILPs.
